

# PRIME FACTORIZATION

## GCD AND LCM

### Properties of Integers

#### Prime Numbers

**Prime number** is a natural number greater than 1 that has no positive divisors other than 1 and itself

The only positive integers that divide a prime number  $p$  are 1 and  $p$

A natural number greater than one that is not a prime number is called a **composite number**

prime composite

## Factoring a number into its primes

Divide by primes: 2, 3, 5, 7, ...

Continue until you get to 1

Write down the products of all prime divisors

$$1386 =$$

	1386

Every positive integer  $n > 1$  can be broken into multiples of primes

$n = p_1^{k_1} p_2^{k_2} p_3^{k_3} \dots p_s^{k_s}$  where  $p_1 < p_2 < p_3 < \dots < p_s$  are prime numbers

## Factoring a number into its primes

Keep dividing the number by a prime

Stop when you get to 1

$$140 =$$

Every positive integer  $n > 1$  can be broken into multiples of primes

$n = p_1^{k_1} p_2^{k_2} p_3^{k_3} \dots p_s^{k_s}$  where  $p_1 < p_2 < p_3 < \dots < p_s$  are prime numbers

## PRACTICE PROBLEMS

Write each integer as a product of powers of primes

- $75 =$

- $512 =$

- $3038 =$

- $3401 =$

## WORKED EXAMPLES

- Find the largest prime divisor of  $5! + 6!$

- Find the prime factorization of  $10!$

## PRACTICE PROBLEMS

- Find the largest prime divisor of  $49! + 50! + 51! + 52!$
- Find the largest prime divisor of  $2^{16} - 1$

7

**GCD** Greatest Common Divisor  
**HCF** – Highest Common Factor

The **largest** int that is a common divisor of a given set of numbers. It divides all integers in the set.

Factors of 15: 1, 3, 5, and 15

Factors of 20: 1, 2, 4, 5, 10, and 20

The GCD of 15 and 20 is 5

**LCM** Least Common Multiple

The **smallest** multiple that two or more numbers have in common. It is a multiple of all int in the set.

Multiples of 15: 15, 30, 45, 60, ...

Multiples of 20: 20, 40, 60, 80, ...

The LCM of 15 and 20 is 60

2	24 , 36 , 54
3	12 , 18 , 27
3	4 , 6 , 9
2	4 , 2 , 3
	2 , 1 , 3

**GCD =  $2 \times 2 \times 3 = 12$**   
**LCM =  $2 \times 2 \times 3 \times 3 \times 2 \times 2 \times 1 \times 3 = 432$**

## Using prime factors to find GCD and LCM

**GCD** – Greatest Common Divisor

$$540 = 2^2 \times 3^3 \times 5$$

$$504 = 2^3 \times 3^2 \times 7$$

Product of common **min**-power

**LCM** – Least Common Multiple

$$540 = 2^2 \times 3^3 \times 5$$

$$504 = 2^3 \times 3^2 \times 7$$

Product of every **max**-power

$$\text{GCD}(a, b) \times \text{LCM}(a, b) = ab$$

## WORKED EXAMPLES

- Find the GCD and LCM of 27, 90, and 84

11

## WORKED EXAMPLES

- The GCD of 70 and some  $n \in \mathbb{N}$  is 10. Their LCM is 210. Find  $n$ .

12

## PRACTICE PROBLEMS

- Find the GCD of  $11!$  and  $6!$
- Find the GCD of  $11!$  and  $5607$

## PRACTICE PROBLEMS

- Find the GCD of  $11!$  and  $(8!)^2$
- The GCD of  $6!$  and some  $n \in \mathbb{N}$  is  $144$ . Their LCM is  $2880$ . Find  $n$ .

## PRACTICE PROBLEMS

- The LCM of two numbers is six times their GCD. The sum of the LCM and the GCD is 210. If one number is 60, then what is the other?

# EUCLIDEAN ALGORITHM

## Properties of Integers

## GCD (47376,78255) = ?

Factoring ?

Make the numbers smaller and find GCD of smaller pairs ...

- $a = kb + r$

Given a & b we can find k & r

- $\text{GCD}(a, b) = \text{GCD}(b, r)$

Integers b & r are smaller than a & b

**Euclidean algorithm** – To compute the GCD of a and b, recursively find k and r such that  $a = kb + r$  and compute the GCD of b and r.

## Use Euclidean Algorithm to Compute GCD(273,98)

Iteration	a	b	r	$a = kb + r$

GCD(273,98) = ?

## Use Euclidean Algorithm to Compute GCD(273,98)

$$a = kb + r$$

From running the Euclid's algorithm, we got the GCD of **not one but multiple pairs** of integers

19

## Extended Euclidean Algorithm

Used to find two integers  $s$  and  $t$  (not necessarily positive) such that

$$\text{GCD}(a, b) = d = sa + tb$$

You are not responsible for a proof of this theorem but *you must be able to compute the GCD and integers  $s$  and  $t$ .*

20

Use Extended Euclid to find  $s, t$  in  $7 = s \times 273 + t \times 98$

$$a = kb + r$$

21

## Extended Euclidean Algorithm

$$\text{GCD}(a, b) = d = sa + tb$$

Find integers  $x$  and  $y$  such that  $z = xa + yb$

If  $z = \text{GCD}(a, b)$ , then  $x$  and  $y$  are  $s$  and  $t$ , by the extended Euclid's alg.

If  $z$  is not equal to the GCD of  $a$  and  $b$ , then we need one extra step

□ Find  $x$  and  $y$  such that  $(x)(273) + (y)(98) = 70$

22

## PRACTICE PROBLEMS

Let  $a=108$  and  $b=60$ , find  $d=\text{GCD}(a,b)$  and find  $s,t$  such that  $d=sa+tb$   
Determine whether there exist  $(x, y) \in \mathbb{Z}$  such that  $108x + 60y = 40$

## PRACTICE PROBLEMS

Given integers:  $a = 7854$  and  $b = 4746$ ,

- determine the least common multiple of  $a$  and  $b$
- find  $x$  and  $y$  such that  $xa + yb = \text{GCD}(a,b)$
- find  $x$  and  $y$  such that  $xa + yb = 1134$
- determine if the equation  $1470x + 168y = 168$  has a solution such that both  $x$  and  $y$  are integers. If it has, then find  $x$  and  $y$ .
