# Logic and Computer Design Fundamentals

## Chapter 2 – Combinational Logic Circuits

### Part 7 – Circuit Optimization (Part 2)

Asst.Prof.Dr. Preecha Tangworakitthaworn  
Semester 2/2023

# Overview

---

- **Part 6 – Circuit Optimization**
  - **Review of Simplification using Karnaugh Map Technique**
  - **K-Map with Don't Care Concept**

# Two Variable Maps

		<b>Y</b>	
		<b>0</b>	<b>1</b>
<b>X</b>	<b>0</b>	<b>00</b> <b><math>\bar{X}\bar{Y}</math></b> <b>0</b>	<b>01</b> <b><math>\bar{X}Y</math></b> <b>1</b>
	<b>1</b>	<b>10</b> <b><math>X\bar{Y}</math></b> <b>2</b>	<b>11</b> <b><math>XY</math></b> <b>3</b>

Assigned values and variables to K-Map

# How to draw K-Map?

Recommend

Assign Boolean expression into K-Map

# K-Map Template (Three Variables)

# Determination of Adjacent Cell

- if the binary value for an index differs in one bit position, the minterms are adjacent on the K-Map

# Determination of Adjacent Cell

- Number of cell for Adjacent on the K-Map must equal to  $2^n$
- Thus, Adjacent must be 1, 2, 4, 8, etc.

# Prime Implicants

- Implicant: A product term that has non-empty intersection with on-set  $F$  and does not intersect with off-set  $R$
- Prime Implicant: An implicant that is not a proper subset of any other implicant i.e. it is not completely covered by any single implicant

Y CD \ AB		AB			
		00	01	11	10
CD	00	1	0	0	1
	01	0	1	0	1
	11	1	1	0	0
	10	1	1	0	1

Q: Is this a prime implicant?

A. Yes

B. No

**Maximum Adjacent Cells=2**

# Prime Implicants

- Implicant: A product term that has non-empty intersection with on-set  $F$  and does not intersect with off-set  $R$
- Prime Implicant: An implicant that is not a proper subset of any other implicant i.e. it is not completely covered by any single implicant

Y CD \ AB		AB			
		00	01	11	10
00	1	0	0	1	
01	0	1	0	1	
11	1	1	0	0	
10	1	1	0	1	

Q: Is the red group a prime implicant?

A. Yes

B. No: Because it is covered by a larger group

**Maximum Adjacent Cells=4**

# Simplification using K-Map

- Step 2: Verify each variable (one by one),
  - 2.1: Adjacent covers either 0 or 1, keep this variable
  - 2.2: Adjacent covers both 0 and 1, remove this variable

# K-Map Template (Four Variables)

# Don't Cares in K-Maps

---

- Sometimes a function table or map contains entries for which it is known:
  - the input values for the minterm will never occur, or
  - The output value for the minterm is not used
- In these cases, the output value need not be defined
- Instead, the output value is defined as a “don't care”
- By placing “don't cares” ( an “x” entry) in the function table or map, the cost of the logic circuit may be lowered.
- Example 1: A logic function having the binary codes for the BCD digits as its inputs. Only the codes for 0 through 9 are used. The six codes, 1010 through 1111 never occur, so the output values for these codes are “x” to represent “don't cares.”

# Don't Cares in K-Maps

---

- **Each don't care “x” entry may take on either a 0 or 1 value in resulting solutions**
  - If X represents 1, this don't' care X can be grouped as adjacent.
  - If X represents 0, this don't care X can be ignored.

# Don't Cares in K-Maps

- Placing “X” for don't care:

$$F(X,Y,Z) = \sum_m (0,5) \text{ and } d(X,Y,Z) = \sum_d (1,4,7)$$

		<b>Y</b>			
		0	0	1	1
<b>X</b>	0	1	x		
	1	x	1	x	
		0	1	1	0
		<b>Z</b>			

# Determination of Adjacent for Don't Cares

---

$$F(X,Y,Z) = \sum_m (0,5) \text{ and } d(X,Y,Z) = \sum_d (1,4,7)$$
