

PROPERTIES OF INTEGERS

EUCLIDEAN ALGORITHM

Finding GCD

INTEGER REPRESENTATION

Base Conversion

Learning objectives! Know what you will learn today

Self-Reflection! Rate levels of your understanding

○ Checklist of key topics. Keep catching up with the course.

- Find GCD using the Euclidean algorithm
- Find s and t using the extended Euclidean algorithm
- Understand values and representations of integers
- Conversion between decimal numbers and other bases
- Conversion between certain bases using grouping of digits

Confident

Got it

Okay

Fuzzy

Not a clue

GCD (47376,78255) = ?

Factoring ?

Make the numbers smaller and find GCD of smaller pairs ...

- $a = kb + r$

Given a & b we can find k & r

- $\text{GCD}(a, b) = \text{GCD}(b, r)$

Integers b & r are smaller than a & b

Euclidean algorithm – To compute the GCD of a and b, recursively find k and r such that $a = kb + r$ and compute the GCD of b and r.

3

Use Euclidean Algorithm to Compute GCD(273,98)

Iteration	a	b	r	$a = kb + r$

$$\text{GCD}(273, 98) = ?$$

4

Use Euclidean Algorithm to Compute GCD(273,98)

$$a = kb + r$$

- From running the Euclid's algorithm, we got the GCD of **not one but multiple pairs** of integers

5

Extended Euclidean Algorithm

- Used to find two integers s and t (not necessarily positive) such that

$$\text{GCD } (a, b) = d = sa + tb$$

You are not responsible for a proof of this theorem but ***you must be able to compute the GCD and integers s and t.***

6

Use Extended Euclid to find s, t in $7 = s \times 273 + t \times 98$

$$a = kb + r$$

7

Extended Euclidean Algorithm $\text{GCD}(a, b) = d = sa + tb$

- Find integers x and y such that $z = xa + yb$
- If $z = \text{GCD}(a, b)$, then x and y are s and t , by the extended Euclid's alg.
- If z is not equal to the GCD of a and b , then we need one extra step

□ Find x and y such that $(x)(273) + (y)(98) = 70$

8

PRACTICE PROBLEMS

Let $a=108$ and $b=60$, find $d=\text{GCD}(a,b)$ and find s,t such that $d=sa+tb$
Determine whether there exist $(x, y) \in \mathbb{Z}$ such that $108x + 60y = 40$

9

PRACTICE PROBLEMS

Find the greatest common divisor d of a and b and write d as $sa+tb$

■ $a = 45$ and $b = 33$

10

PRACTICE PROBLEMS

Find the greatest common divisor d of a and b and write d as $sa+tb$

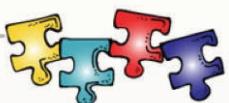

■ a = 77 and b = 128

11

PRACTICE PROBLEMS

Given integers: a = 7854 and b = 4746, find x and y such that $xa + yb = \text{GCD}(a,b)$ and then determine the least common multiple of a and b

12

What will be on the quiz?

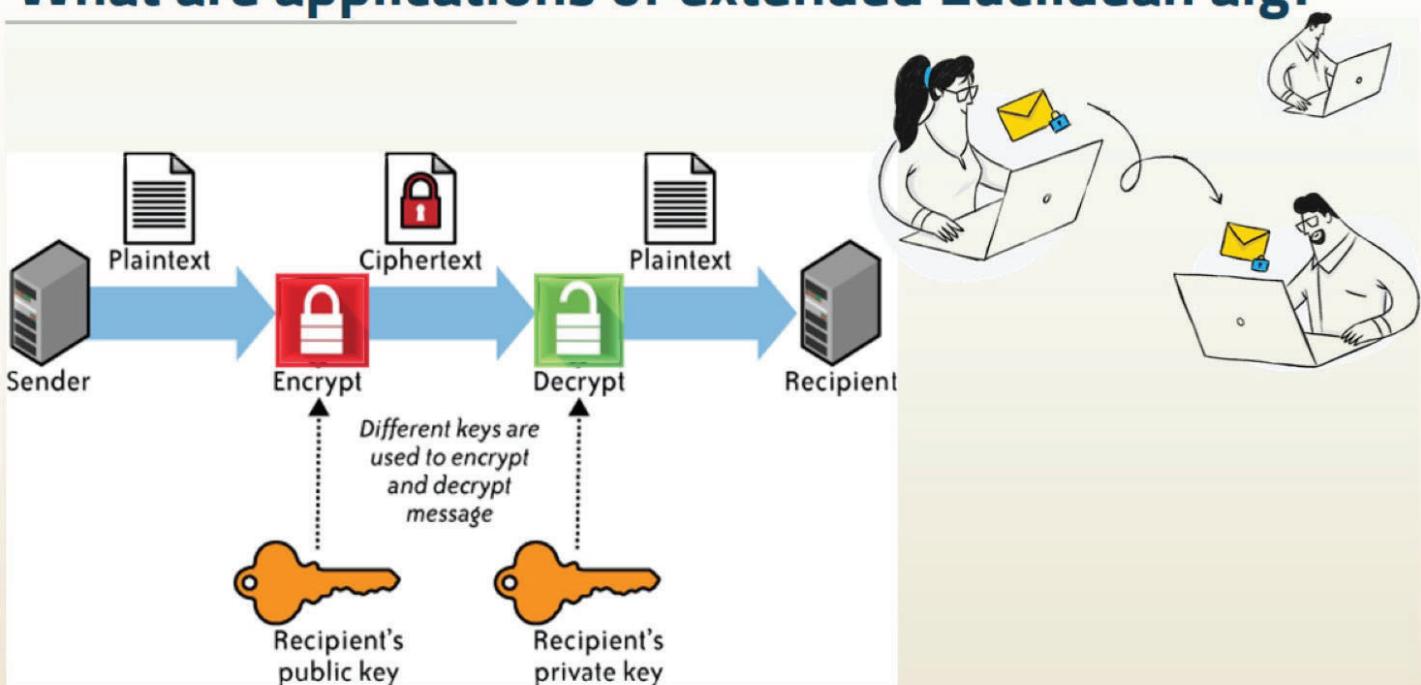

- Use Euclidean and the extended algorithms to compute $\text{GCD}(a,b)$ and s and t . Fill in the values of a & b at each iteration
- ... with a couple of follow-up questions

Iteration	a	b
1	?	?
2	?	?
3	?	?
4	?	?

13

What are applications of extended Euclidean alg?

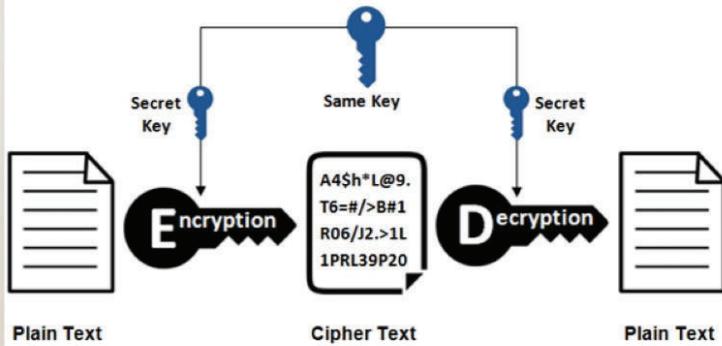

14

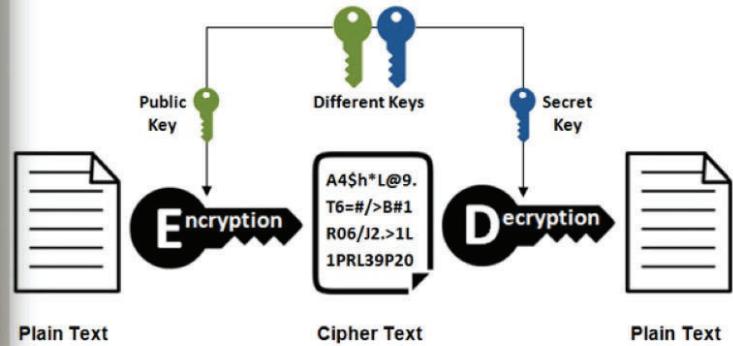

Why we need s and t ?

$\text{GCD}(a,b) = d = sa + tb$ Why do we need to calculate it? What is it for?

Symmetric Encryption

Asymmetric Encryption

Caesar Cipher is one of the simplest symmetric encryption techniques

Public-private keys are different but mathematically linked

REPRESENTATIONS OF INTEGERS

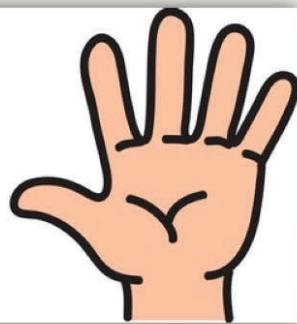

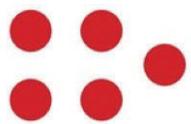

Properties of Integers

COUNTING TO "FIVE" ...

REPRESENTING THE VALUE "FIVE" ...

5

17

To represent any number, no matter how large or how small

Numbering Systems	Base	Digits	These are common bases in digital technology; in general, base $b \in \mathbb{Z}^+$
Binary	2	0, 1	
Octal	8	0, 1, 2, 3, 4, 5, 6, 7	
Decimal	10	0, 1, 2, 3, 4, 5, 6, 7, 8, 9	
Hexadecimal	16	0, 1, 2, 3, 4, 5, 6, 7, 8, 9, A, B, C, D, E, F	

- Know how to **count** and how to **convert** from one base to another
- Know how to **add, subtract, multiply**, and **divide** in different bases
- Know how to encode & decode messages using base 26 **Bacon's code**

18

3 5 0 1 (base 10)

The diagram illustrates the conversion of the base 10 number 3501 into its expanded form. The number is shown as 3 5 0 1. Colored arrows point from each digit to its corresponding term in the expanded form below:

$$\begin{aligned} 1 \times 10^0 &= 1 \\ 0 \times 10^1 &= 0 \\ 5 \times 10^2 &= 500 \\ 3 \times 10^3 &= \underline{\underline{3000}} \\ &\quad 3501 \end{aligned}$$

- Each position to the left of the decimal point has the **base value** equal to **the base raised to the power of the position** where the first position is zero. In decimal, this is $10^0=1$; $10^1=10$; $10^2=100$.

19

3 5 0 1 (base 10)

The diagram illustrates the conversion of the base 10 number 3501 into its expanded form. The number is shown as 3 5 0 1. Colored arrows point from each digit to its corresponding term in the expanded form below:

$$\begin{aligned} 1 \times 10^0 &= 1 \\ 0 \times 10^1 &= 0 \\ 5 \times 10^2 &= 500 \\ 3 \times 10^3 &= \underline{\underline{3000}} \\ &\quad 3501 \end{aligned}$$

3 5 0 1 (base 8)

The diagram illustrates the conversion of the base 8 number 3501 into its expanded form. The number is shown as 3 5 0 1. Colored arrows point from each digit to its corresponding term in the expanded form below:

$$\begin{aligned} 1 \times 10^0 &= 1 \\ 0 \times 10^1 &= 0 \\ 5 \times 10^2 &= 500 \\ 3 \times 10^3 &= \underline{\underline{3000}} \\ &\quad 3501 \end{aligned}$$

Conversion from any base b to base 10

1	8	2	7	3	6
---	---	---	---	---	---

 \xrightarrow{10 \times 16^3 = 40960} \\
 \hline
 41719
 \end{array}
 \end{array}$$

- Base 8 has 8 digits: 0-7
- Base 10 has 10 digits: 0-9
- Base 16 has 16 digits: 0-9 , A-F
- A base can be any integer $b > 0$

WORKED EXAMPLES

- Convert a binary number 111000 to decimal

WORKED EXAMPLES

- Convert $0x5D5E$ to decimal number

Notation: when writing a hexadecimal number (base 16), it is preceded with $0x$. That is, $0x5D5E = 5D5E_{16}$

Convert 432 base 10 to base 5

- Repeatedly divide 432 by 5 until the quotient is less than the divisor.
- The result is the remainder read from the bottom up.

Conversion from base 10 to any base b

WORKED EXAMPLES

- Convert a decimal number 23902 to base 18

25

What have we learned so far?

- Convert from any base b_1 to base 10 – by **power expansion**
 - Convert from base 10 to any base b_2 – by **repeated division**
- Therefore, through base 10, we can convert from any base b_1 to b_2

26

Convert the number 5D5E base 16 to base 18

Step1: convert base 16 to base 10

Conversion
between
bases other
than base 10

Step2: convert base 10 to base 18

Note: we did both of
these conversions in
the previous worked
examples

27

WORKED EXAMPLES

Convert the number 4067 base 23 to hexadecimal

Step1: convert base 23 to base 10

Step2: convert base 10 to base 16

28

PRACTICE PROBLEMS

- Convert the number A5BC base 13 to base 6

Step1: convert base 13 to base 10

Step2: convert base 10 to base 6

29

PRACTICE PROBLEMS

- Convert the following numbers to base 10

I. $(100110101)_2$

II. $(666421)_7$

III. $(1GA5)_{17}$

30

PRACTICE PROBLEMS

Convert the following decimal numbers to the bases stated.

I. 55 to binary

II. 56789 to base 9

III. 493314 to base 14

PRACTICE PROBLEMS

Perform the following base conversions

I. 4 base 6 to base 20

II. D base 14 to base 13

III. 3207 octal to base 12

PRACTICE PROBLEMS

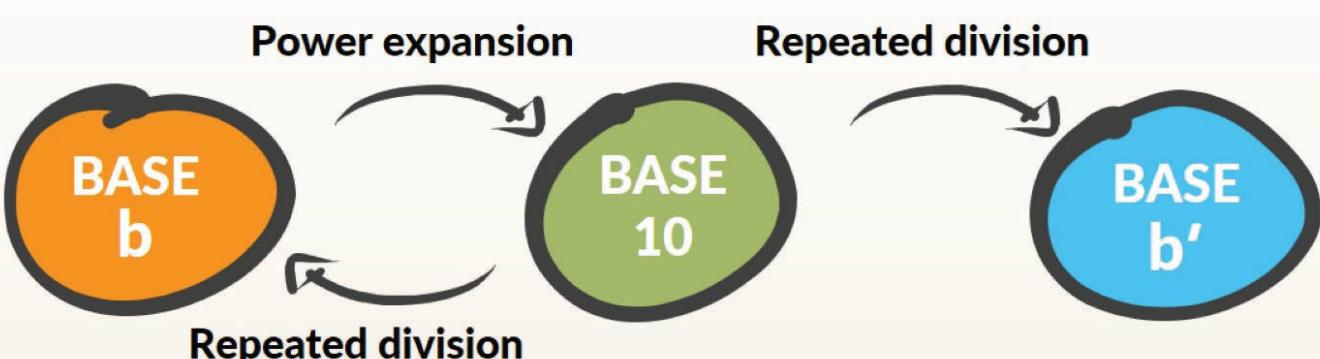

Perform the following base conversions

- IV. 0xAF4 to base 7
- V. 3210 base 5 to base 3
- VI. 212 base 3 to base 5

33

Conversion between any bases

A one-step conversion
between non-decimal
number bases b and b'

34

Base conversion trick by grouping of digits

- This is related to factorization and the distributive law Base 2 to 4

$$100111_2 = 1 \times 2^5 + 0 \times 2^4 + 0 \times 2^3 + 1 \times 2^2 + 1 \times 2^1 + 1 \times 2^0$$

35

Base conversion trick by grouping of digits

- This is related to factorization and the distributive law Base 2 to 8

$$100111_2 = 1 \times 2^5 + 0 \times 2^4 + 0 \times 2^3 + 1 \times 2^2 + 1 \times 2^1 + 1 \times 2^0$$

36

Conversion without converting to decimal numbers

- To convert from base 2 (binary) numbers to base 8 (octal) numbers,
 - group binary digits into groups of 3 bits, start grouping from the least significant bit. Then, write each group in octal digit.

1 100 101 011 111₂ ⇒

- From octal to binary, encode each octal digit using 3-bits binary

62510₈ ⇒

37

Base conversion trick by grouping of digits

- Between **binary** & base **4** → group binary digits into group of _____
 - We need **2** binary-bits to write the digits 0,1,2,3 of base 4 → $2^2=4$
- Between **binary** & base **8** → group binary digits into group of _____
 - We need **3** binary-bits to write the digits 0,1,2,3,4,5,6,7 of base 8 → $2^3=8$
- Between **binary** & base **16** → group binary digits into group of _____
 - We need **4** binary-bits to write the digits 0,1,2,3,...,14,15 of base 16 → $2^4=16$

From smaller to larger base -> go from n digits to 1 digit
From larger to smaller base -> expand each digit to n digits

38

Base conversion trick by grouping of digits

- In the following, if the trick applies, how many digits are grouped?

Base 3 and 9

Base 3 and 27

Base 4 and 8

Base 4 and 16

Between which other bases would this conversion trick apply?

This works when the larger base is some power of a smaller base.

39

WORKED EXAMPLES

- Convert 123103312 in base 4 to hexadecimal

40

WORKED EXAMPLES

- Convert $(K9)_{27}$ to base 3

41

PRACTICE PROBLEMS

- Convert $(1101\ 0101\ 1100\ 1111)_2$ to base 4, octal, and hexadecimal
- Convert $(1AB8D94E)_{16}$ to binary, base 4, and octal number

42

PRACTICE PROBLEMS

- Convert $(4353)_8$ to base 4, base 16, and base 64
For base64, use alphabets: 012...789ABCD...XYZabc...xyz+=

- Convert $(111)_6$ to base 3 and base 36

43

PRACTICE PROBLEMS

Convert the following to base 5.

- 25050 base 10

- DANCE base 25

- ZEBRA base 50

44

PRACTICE PROBLEMS

■ Determine which of the following numbers are multiples of five. Select all that are true. Hint: think divisibility and power expansion, a full conversion to decimal numbers is not needed.

$(117)_9$

$(111100)_2$

$(4105)_6$

$(A1BA)_{15}$
